PROFESSIONAL SUMMARY

IT/ITSM professional transitioning into cybersecurity and security operations, with a background administering enterprise ITSM platforms, managing incidents and service requests, and supporting IT infrastructure. Completed the Google Cybersecurity Professional Certificate, building hands-on skills in Linux, networking, Python, SQL, security risk assessment, network traffic analysis, and access control through applied labs. Seeking to apply a strong operational foundation and growing technical security skill set in an entry-level SOC Analyst or Cybersecurity Analyst role.

TECHNICAL SKILLS

Cybersecurity: Security fundamentals, incident analysis, incident reporting, security risk assessment, security controls, vulnerability assessment fundamentals, NIST Cybersecurity Framework concepts, access control, authentication, authorization

Networking: TCP/IP, DNS, UDP, ICMP, network traffic analysis, tcpdump, network troubleshooting

Linux: Linux command line, file permissions, chmod, chown, user management, group management, authentication, authorization

Programming & Automation: Python, file handling, lists, loops, conditional statements, security automation

SQL: SQL fundamentals, security-related SQL analysis

IT Operations: ITSM, Freshservice, incident management, service request management, ticket management, asset management, IT documentation, Windows support, hardware/software troubleshooting, network troubleshooting

PROFESSIONAL EXPERIENCE

IT Support / ITSM Administrator

Gulf Cement Company (GCC), UAE | November 2025 – Present

- Administer ITSM processes using Freshservice, managing incidents and service requests through the platform.
- Assign and escalate tickets according to operational requirements, maintaining consistent resolution tracking.
- Maintain IT documentation and asset records, supporting IT asset inventory and tracking.
- Prepare IT KPI reports and operational documentation for management review.
- Provide IT support and troubleshoot hardware, software, Windows systems, printers, and user issues.
- Troubleshoot network connectivity and Wi-Fi issues; support installation and configuration of printers and other IT equipment.
- Assist with Windows system setup, resets, software installation, and troubleshooting.
- Support users with Microsoft Office and other enterprise applications; assist with IT infrastructure and operational support activities.

CYBERSECURITY PROJECTS & HANDS-ON LABS

Hands-on training projects completed as part of the Google Cybersecurity Professional Certificate — not professional employment.

Python IP Allow-List Automation

- Developed a Python script to automate updates to an IP allow list by reading addresses from a file and removing entries present on a separate remove list.
- Applied file handling, lists, loops, and conditional statements to support access control for a simulated healthcare environment.
- Demonstrated how automation reduces manual error in maintaining accurate, current access-control records.

Network Traffic Analysis & Incident Report

- Analyzed tcpdump network traffic logs to investigate DNS, UDP, and ICMP communication patterns.
- Interpreted ICMP error responses and traced source/destination communication on port 53 (DNS).
- Documented findings in a structured incident report explaining the traffic pattern and its likely cause.

Botium Toys Security Risk Assessment

- Defined audit scope and security goals for a simulated organization, Botium Toys, as part of a risk assessment exercise.
- Identified organizational assets and evaluated existing security controls against compliance and best-practice expectations.
- Produced a structured risk assessment report referencing NIST Cybersecurity Framework concepts.

Linux File Permissions & Access Control

- Configured file and directory permissions using chmod, working with permission strings and hidden files.
- Applied ownership-based access control using chown to manage user and group-level access.
- Practiced least-privilege access principles across a simulated Linux file system.

Linux User & Group Management

- Created and managed Linux users and groups using adduser and usermod, configuring primary and secondary group membership.
- Applied sudo for privileged actions and reinforced authentication and authorization concepts.

Linux File Ownership

- Assigned file ownership to a designated Linux user using chown and verified resulting access-control behavior.

Incident Report Analysis

- Reviewed provided evidence from a simulated security incident, identified key findings, and documented results in a structured incident report.

tcpdump Network Traffic Log Analysis

- Analyzed network traffic logs to trace source/destination communication, DNS requests, UDP traffic, and ICMP responses for troubleshooting purposes.

CERTIFICATION

Google Cybersecurity Professional Certificate — Google / Coursera

EDUCATION

B.Tech, Electronics and Communication Engineering

Presidency University, Bengaluru | Graduated June 2023 | CGPA: 6.69

ACADEMIC PROJECTS

- IoT-Based Automation — final-year engineering project exploring device automation (academic coursework).
- Temperature and Humidity Monitoring Using Cloud — sensor-based monitoring system with cloud data logging (academic coursework).
- Crime/Anomaly Activity Detection Through Video — video-analysis approach for flagging anomalous activity (academic coursework).
